Instructions for Use

- **HOMES** Multi-disciplinary Hoarding Risk Assessment provides a structural measure through which the level of risk in a hoarded environment can be conceptualized.
- It is intended as an *initial* and *brief* assessment to aid in determining the nature and parameters of the hoarding problem and organizing a plan from which further action may be taken-- including immediate intervention, additional assessment or referral.
- HOMES can be used in a variety of ways, depending on needs and resources. It is recommended that a visual scan of
 the environment in combination with a conversation with the person(s) in the home be used to determine the effect of
 clutter/hoarding on Health, Obstacles, Mental Health, Endangerment and Structure in the setting.
- The Family Composition, Imminent Risk, Capacity, Notes and Post-Assessment sections are intended for additional information about the hoarded environment, the occupants and their capacity/strength to address the problem.
